

Work report 8 July 2021

Today I have trained the model on 0.001 learning rate . The first time I was training , due to network loss the runtime disconnected after 100 epochs then I restart the training .

This this the runtime got disconnected after 125 epoches. I have saved weight for 121 th epoch so this this what I have done is this:

In the pretrained weight I have given my weight of 121 th epochs then start retraining the model

The loss starts from 3 this time

By this I trained the model till 29 th epoch then the gpu limit is reached

Question:

1. Is the method which I have used is right?
